

Turning Down the Jab:

Using regression to explore factors
associated with low COVID vaccination
rates in the US

Maya Remington
August 6, 2021

The Problem

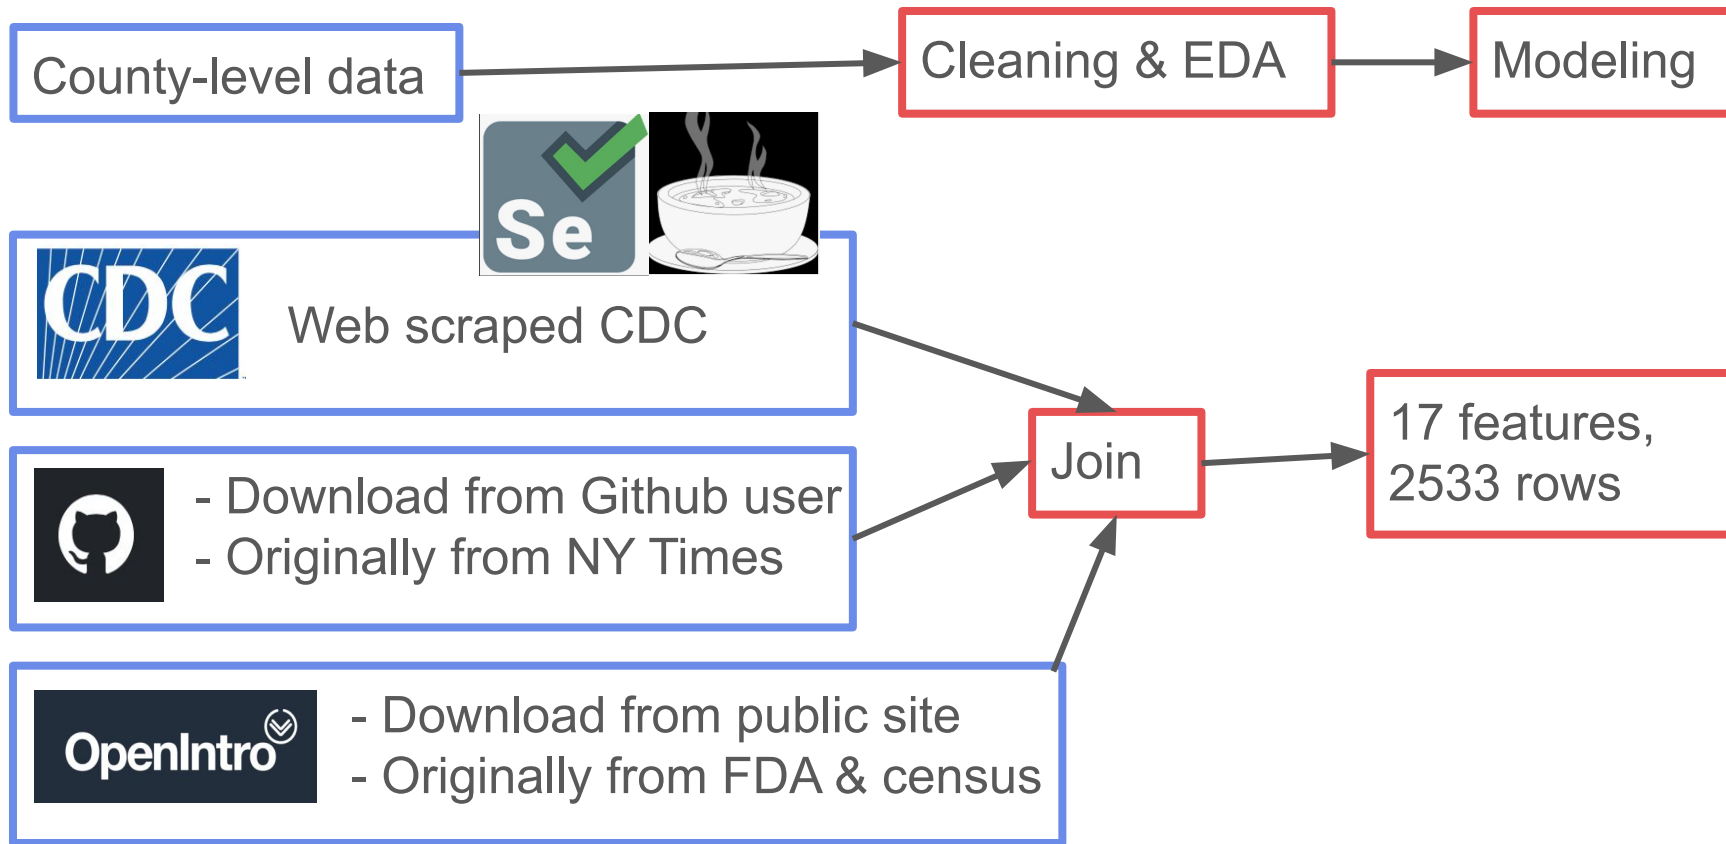

Daily Cases in US

- COVID-19 cases are rising again
 - Fueled by the delta variant
 - Primarily affecting the unvaccinated (~ 30% of US adults)

Q: What political and socioeconomic factors best explain the variation in vaccination rates at the county level?

Data & Methods

Key Calculations

Target: % **unvaccinated adults**

= 1 - % adults with at least 1 shot

% diff (aka 'vote split') in 2020

Presidential election

= % GOP vote - % Dem vote

The remaining features

- % Race/ethnicity: asian, black, hispanic, native, pac islander, white
- Education level: % HS grad, % bachelors
- Economic factors: % poverty, % uninsured, median household income
- Access to technology: % have computer, % have smartphone
- Other: age 65+, population density, household size

The remaining features

- % Race/ethnicity: asian, black, hispanic, native, pac islander, ~~white~~
- Education level: ~~% HS grad~~, % bachelors
- Economic factors: % poverty, % uninsured, ~~median household income~~

- Access to technology: ~~% have computer~~, ~~% have smartphone~~
- Other: age 65+, population density, ~~household size~~

Improving the model

Feature modeling and regularization applied to 5-fold cross validation:

Model	OLS (baseline)	Interaction terms	Polynomial terms	Lasso	Ridge
R-squared	0.392	0.399	0.398	0.394	0.392

Final model: OLS scaled

Train

- R^2 : 0.399

- MAE: 8.70

Test

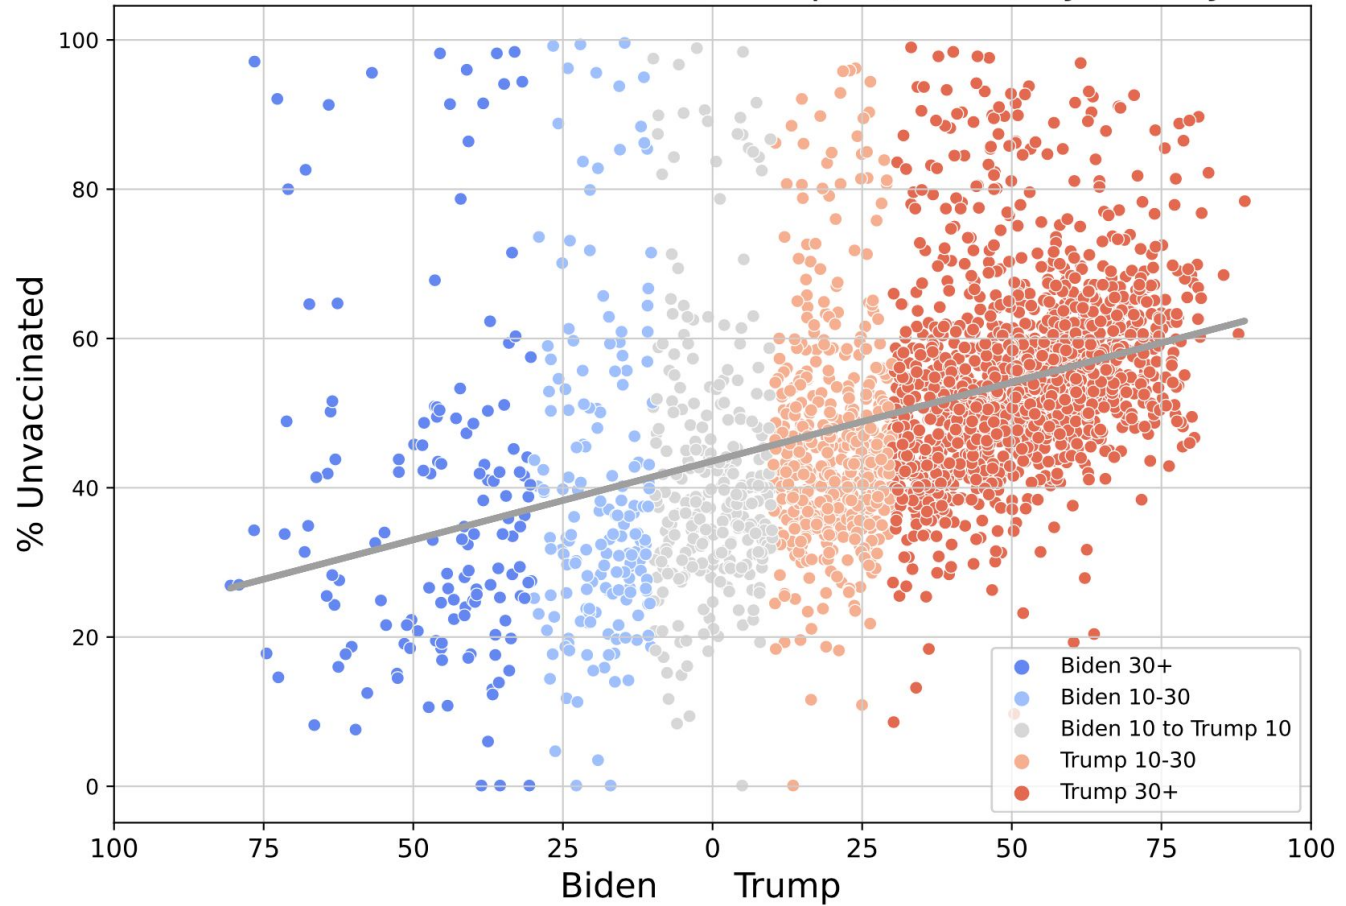

- R^2 : 0.425

- MAE: 8.14

% Unvaccinated vs 2020 Vote Split (% diff) by county

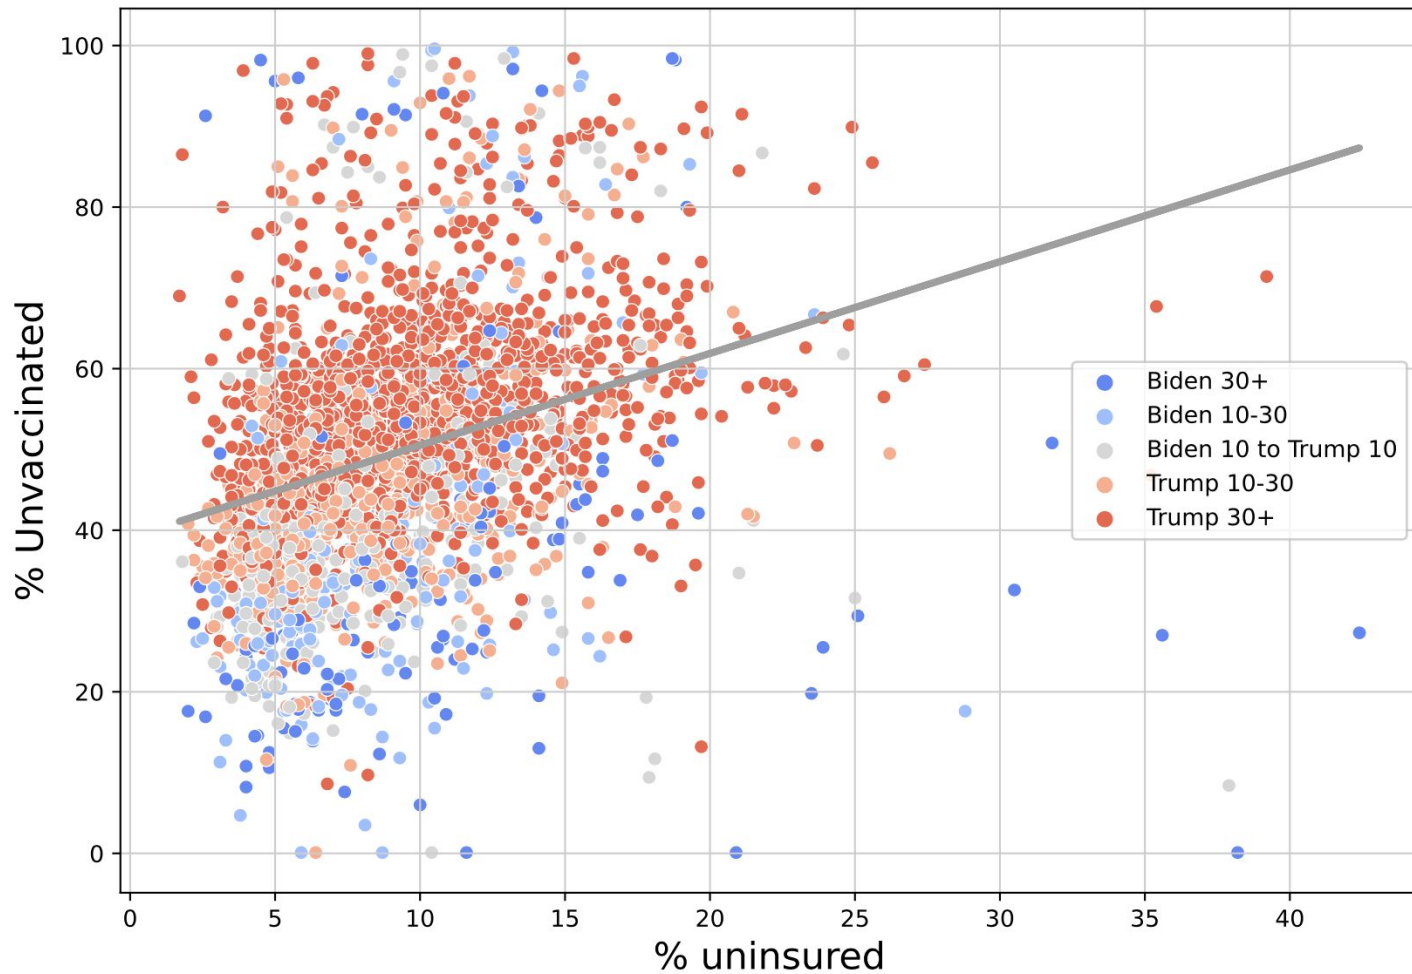

Largest
coefficient

2nd largest
coefficient

3rd largest
coefficient

Conclusions

What political and socioeconomic factors best explain the variation in vaccination rates at the county level?

- vote split (% diff)
- % black population
- % uninsured

Future Work

- Try removing some of the features
- Try using more metrics

Thanks!
